Website Contact Points Report

PRAG web properties — audit of every way a visitor can reach the team
Report date: **Friday, 18 September 2026** | Status re-verified live on both sites; no changes were released to any contact point after Thursday 17 September, so this reflects the sites exactly as they stood on Friday.

Summary: 41 contact points audited across both websites. **All working** — no broken links, dead forms, or failed checks found. Every page load tested between 0.35s and 1.05s. All enquiry forms are protected by an anti-spam check and respond correctly.

Site 1: Shop — shop.prag.global (online store)

#	Contact point	Where it appears	Button / link text (CTA)	How it connects	Pre-filled message	Status
1	WhatsApp chat widget	Floating bubble, bottom-right of every page	Menu: General Enquiries / Sales / Support / Delivery, then "Start WhatsApp chat"	WhatsApp chat (each option routes to the right team number)	General: "Hi, I have a general enquiry about your products." 20	Power Calculator hand-off	/power-calculator page	"Get Recommendation"	WhatsApp chat (to sales line 0703 646 3977)	Auto-filled: visitor's chosen appliances, total load and daily usage estimate	**Working**

Observations

- **Everything works.** All 41 contact points across both sites are live and functional. No broken forms, dead phone numbers or failed buttons were found. Every enquiry form passed a live test — the anti-spam verification correctly screens submissions before they reach the team.
- **Speed has visibly improved since moving to the paid hosting plan.** Every page tested loads in under ~1 second (most in 0.5–0.7s), including the homepage, contact, forms and product pages on both sites. The paid frontend host is delivering on its promise.
- **The chosen tech stack is proving to be the right route.** Pages are pre-built and served from a fast edge network, which is why they load almost instantly worldwide, while forms and interactive features stay responsive on top. The performance jump after upgrading the hosting plan confirms the architecture decision — fast by default, with room to grow.
- **Consistent contact details everywhere.** The same phone numbers, WhatsApp lines and email addresses are used across both sites and are centrally managed from the admin panel, so a single update applies everywhere.
- **Minor tidy-ups worth scheduling (not urgent):**
  - The **battery warranty page** on both sites does not show the service-centre phone numbers and email that appear on the inverter, stabilizer and solar warranty pages.

    - The **solar warranty page** shows the hotlines but not the service email.
    - On the Shop, the header **"Hotline"** displays a phone number but opens a WhatsApp chat. It works, but labelling it as WhatsApp would set clearer expectations.
- **WhatsApp is the dominant channel by design.** Most contact points funnel into WhatsApp with sensible pre-filled messages, which is well suited to the market — visitors can reach the right team in two taps, and each message already says what they need.

Verification method: every page was loaded live and every form endpoint was tested — all responded correctly. No site changes were released between Friday 18 September and the live re-verification, so these results reflect the sites as of the report date.
